The percentage of INTJs in the world's population is 2%, and the percentage of lefties is 10%. How do I calculate the percentage of left-handed INTJs?

Well, if you can assume that each MBTI type has an even distribution of left-handedness, then you could assume that INTJs are 10% left-handed (and .2% of the total population is Lefty-INTJ).

However, a quick internet search suggests this assumption may be inaccurate:

1. Left/Right handed and MBTI type
2. Left-handed Sensor types appearing to be like Intuitive types

Neither source is scientifically satisfying. Source 1 looks promising, but dig into their methodologies and results and I feel it doesn't warrant drawing any useful conclusions.

~90 % of people are right-handed, which means the left hemisphere of their brains is dominant.

People who are analytical, methodical thinkers, are believed by many to be *right-brain* dominant.

If the second part of this research can be verified, then INTJs may be more prone to being left-handed than the general public, so you'd have to probably do research to quantify and solve for X. The percentage of INTJs that are left-handed, which may be > 10%- because they're INTJs, I think you might need to set up an equation with more than 2 variables.

If there were no correlation between handedness and personality (doubtful), then it would be (.10) times (.02) = .002, or 2/10 of 1 %.

HOWEVER, the marginalization of minority-handedness may tend to drive developing personalities INWARD with their inescapable mandate of solitary adaptations to a social / mechanical / environmental landscape of right-handed people.

If you want to assume that lefties and INTJs are independently distributed, then of course you will calculate that the percentage of left-handed INTJs is 0.02 * 0.10 = 0.002 or 0.2%.

But this ignores the possibility that they are not independent, and that there is a correlation between being INTJ and being left-handed.

What are sad hard truths about INTJs, which those whom INTJs wannabes should consider that the fact being an INTJ is not that 'fun' or 'cool'?
I have abstained from MBTI questions for a long while, but recently I came back to it due to some mysterious inspiration to motivate others. I apologise to my philosophy readers in advance.

Overcompensation of Identity

The hard truth is that INTJs, like INFJs, are overglamorised as personality archetypes. These types have been portrayed with almost sacred portrait of human saints who can do no wrong. In fact, INTJs are human, and they need to be constantly reminded that they are human.

I have thought long about the r[illegible] and the 'real' INTJs. At first, I

How do non-INTJ feel about INTJs?
ENFP here:

One of my best friends of 10 years is an INTJ and here's how I feel about her.

In the beginning, when we first met in highschool, I believed that we were two polar opposites with completely different values. I felt that she took school way too seriously for my liking and that she was insensitive to people's feelings. I also thought that she was not as sweet and considerate as my other best friend (INFJ). Gosh was I wrong!

Once I got to know her more, I [illegible] e most dedicated and caring

1) Mastermind(s). Not in the sense that we are all knowing. We just hate surprises. In my case, this involves intently avoiding any unfamiliar ground. In order to step onto that ground, I will examine it from as many angles as possible. This requires almost constantly running scenarios wherein every conceivable variable is explored. Encountering unpredicted events is negated by the ability to rapidly construct a response from the results of the other analyses. This presents an appearance of calm preparedness. Calm because we must anxiety away.

What is the probability that an INTJ is also left-handed?
If the probabilities are independent, then 10% of the INTJ population are left-handed. However, I doubt that the probabilities are independent.

Why, do I doubt this? Because, if you take a sampling of software engineers (say at a lunch) and ask how many are left-handed, you will get approximately 25-40% of them raising their hand. (I haven't taken this measure in a while.) Similarly, if you as how many are INTJs you will get a larger number than 3% of them raising their hand, and that isn't adjusting for the fact that a reasonable percentage don't know their MBTI type.

Why do lefties constitute only 10% of the total population of the world? Is it some kind of disability?
It is not a disability. We lefties are definitely differently-abled, as our right hemispheres of the brain are more active.

Where I come from, being a left handed person is considered to be evil/ dirty (because in India left hand is used to clean up potty, hence left hand is also called as "potty hand"/ inauspicious. I remember if I had to apply vermilion, I was forced to do it with my right hand. All the auspicious work was to be done with right hand. Even watering plants must be done w[illegible] not left. It felt like punishment

If only about 10% of the population is left handed, why is that percentage so low?
Originally Answered: Why are only 10% of the people in the world left handed?
Today about one tenth of the worlds population are left handed

Archeological evidences show that it has been that way for as long as 500,000 years, with about 10% of human remains showing the associative differences in **arm length & bone density.** Some ancient tools were also designed for lefties which were examined while excavations. Those tools which were found were artefacts showing the left hand use. Evolution has produced them in just this ratio and maintained it over the course of millennia.

Now the theory for the handed[illegible] expected is it actually always
